Subcutaneous Immunoglobulin (SCIg) Therapy

General Information

Updated September 2022

Immunoglobulins (commonly known as antibodies) are used to treat adults and children with primary immune deficiencies (PID), also known as inborn errors of immunity, and other medical conditions, who are unable to make enough of their own antibodies, or who have antibodies that don’t work properly.

Replacing these antibodies helps to protect against infection and can prevent long term damage from ongoing infections, such as chronic lung disease.

What is SCIg?

Subcutaneous Immunoglobulin (SCIg) infusions are given by slowly injecting purified immunoglobulin into fatty tissue just underneath the skin. SCIg:

- Requires frequent administration (ranging from 1-3 times per week to once a fortnight) by patients or carers at home.
- Involves slow diffusion of IgG from subcutaneous tissue.
- Is associated with more consistent serum IgG levels due to frequent administration.
- Is administered at multiple injection sites according to personal preference, usually in the lower abdomen. However, the outer edge of the thigh or back of the upper arm can also be used.

How are SCIg infusions given?

SCIg can be given at home using:

- Mechanical infusion pumps - spring loaded or battery powered.
- Push method - a manual method that does not require a pump, with the infusion pushed by hand through a syringe.

Immunoglobulin products are safe

SCIg is very well tolerated and safe. SCIg is made from plasma (the liquid part of blood), which comes from blood donors who are checked to make sure they are healthy and do not have certain infectious diseases. Manufacturers also include steps in the processing of blood or plasma that inactivate or remove viruses.

This means that there is an extremely low (almost zero) chance of the transmission of blood borne viruses (such as Hepatitis B, Hepatitis C, HIV and Variant Creutzfeldt-Jakob disease (also called “mad cow disease”) via SCIg.

What are the risks associated with SCIg?

Reactions or side effects to SCIg include:

- **Common injection site reactions** such as redness, swelling and itching.
  - These are usually mild and go away over a day or two.
  - Reactions are generally worse with the first few infusions and get better over time.
  - Most itching is resolved by slowing the infusion.
- **Uncommon side effects** such as headache, feeling hot, nausea, diarrhoea, sore throat, rash, increased cough and back pain.
  - These are usually mild.

- **Extremely rare and serious side effects** such as allergic reactions, kidney problems or blood clots.

If a reaction occurs you must inform your nurse specialist or doctor as soon as possible and get advice before having any more infusions.

For information about managing reactions see pages 6 and 7 of this document.

### What needs to be done before starting SCIg?

Before you start on SCIg, your nurse specialist will provide you with information and training on how to give SCIg at home. Nurses play a crucial role in educating and supporting people who are being treated with immunoglobulin products.

You will need to sign a consent form to say that you understand the need for treatment and the chance of reactions that may occur with the treatment.

This plan has been developed as a medical document to be completed by an immunology or nurse specialist, when a patient is transitioning from:

- Paediatric to adult medical care.
- One region to another.
- IVIg to SCIg.
- SCIg to IVIg.

### Choosing a SCIg infusion site

Using the same site for infusions can help reduce the amount of local swelling and redness that can occur after an infusion.

However, multiple (2-3) sites can be used on a rotating basis, according to patient preference.

Rotating the infusion site is preferable for some patients and this may reduce the risk of scar tissue developing.

SCIg injection sites are usually in the lower abdomen, but the outer edge of the thigh, buttocks or back of the upper arm can also be used. Avoid bony areas such as the hips.

When using the lower abdomen in adults and most children, the needle should be inserted at least 5cm away from the belly button.

If using more than one site at a time, make sure they are at least 5cm apart.

**Note:** Do not insert the needle where the skin is scarred, bruised, broken or inflamed (such as eczema).
Before infusion it is important to have your equipment ready – see the ASCIA Subcutaneous Immunoglobulin (SClg) Equipment Checklist www.allergy.org.au/patients/immunodeficiencies/scig-therapy-equipment-checklist

An ASCIA Subcutaneous Immunoglobulin (SClg) Infusion Checklist is also available at www.allergy.org.au/patients/immunodeficiencies/scig-infusion-checklist

It is recommended to have a cold pack, a non-drowsy antihistamine and an analgesic (pain medication) available in case of a mild reaction.

Examples of SClg infusions are shown below.

![Image of SClg infusion](image1)

![Image of SClg injection](image2)

Documenting the SClg infusion

Patients should record the following details in a SClg infusion diary, which can be shown to the nurse or medical specialist:

- Brand of SClg product.
- Batch number/sticker.
- Date and time of infusion.
- Time taken for infusion.
- Dose.
- Reactions to infusion.
- Problems with product (e.g. visible particles - not used and returned).
- Unused or wasted product (e.g. spilled/damaged or infusion stopped due to adverse reaction).

Ordering, collection, transport and storage of SClg

- Use the ASCIA SClg Treatment Plan, which is available on the ASCIA website www.allergy.org.au/hp/papers/ascia-scig-treatment-plan
- SClg product needs to be ordered in advance.
- Your nurse specialist or doctor will explain how and where to collect the SClg product and this should be included in your SClg treatment plan.
- SClg must be kept cool (2-8°C) for the journey home:
  - When collecting SClg you must provide a cool box or cool bag large enough to transport vials with an icepack. Ensure SClg vials are not in direct contact with the ice, to avoid possible freezing.
  - Take SClg home immediately and place in a sealed container in the central part of the refrigerator.
• Storage temperatures are dependent on product choice (refer to information about each product below). Your nurse or medical specialist will advise you how to store the specific SCIg product you are using. However, the following principles should be followed for all SCIg products:

✓ Store SCIg in original packaging until needed, and protected from light.

✓ Store SCIg between 2°C and 25°C and avoid extreme temperatures.

✗ Do not freeze SCIg - never store below 2°C and do not use SCIg that has been frozen.

✗ Do not shake SCIg.

If you have a power or refrigerator failure and are unable to keep SCIg refrigerated:

• Contact your nurse specialist as soon as practical for further advice.

• If fridge is still cold, keep your supply in the fridge.

• If the fridge is no longer cold, place SCIg in your transport cool box or cool bag with an ice pack.

Product from a vial is for single use only

• Once the vial is opened, SCIg needs to be used as soon as possible as the product does not contain preservative.

• If an infusion cannot be completed within the recommended time (which varies between 2 and 4 hours for different products), any unused product should be discarded.

• All SCIg vials must be disposed of in the sharps container provided by your hospital. These should be returned to the hospital or pharmacy. SCIg vials must not be discarded in your household bin.

SCIg Products

There are currently three different brands of SCIg available in Australia and New Zealand:

• Hizentra® - CSL Behring

• Evogam® - CSL Behring

• Cuvitru® - Takeda

SCIg Product - Hizentra®

• Once removed from the refrigerator, store Hizentra® between 2°C and 25°C and use until expiry date.

• Hizentra® is a clear, pale yellow to light brown solution.

• Do not use if the solution is cloudy or contains particles.

• Complete Hizentra® infusions within 4 hours of starting infusion.

• For instructions go to https://www.nps.org.au/medicine-finder/hizentra-vial
SClg Product - Evogam®

- Once removed from the refrigerator, store Evogam® between 2°C and 25°C and use within two weeks.
- Evogam® is a clear, pale-yellow to light brown solution.
- Do not use if the solution is cloudy or contains particles.
- Complete Evogam® infusions within 4 hours of starting the infusion.
- For instructions go to https://www.nps.org.au/medicine-finder/evogam-solution-for-injection

SClg Product – Cuvitru®

- Store between 2°C and 8°C, this is a change from below 25°C.
- The shelf life is now 36 months, this is an increase from 24 months.
- Cuvitru® is a clear and colourless to a pale yellow or light brown solution.
- Do not use if the solution is cloudy or contains particles.
- Complete Cuvitru® infusions within 2 hours of starting the infusion.
- For instructions go to https://www.nps.org.au/medicine-finder/cuvitru

Note: The National Blood Authority (NBA) advises that Cuvitru is transitioning to a revised temperature and storage requirement from 12 September 2022 in accordance with product registration changes on the Australian Register of Therapeutic Goods. Future Cuvitru stock will be labelled to specify the revised shelf life and temperature storage requirements.

Checking SClg vials before an infusion

All SClg vials should be checked for the following prior to an infusion:

- Expiry date on the vial - **DO NOT USE** if out of date.
- Protective cap is in place - **DO NOT USE** if seal is broken.
- Solution in vial is clear - **DO NOT USE** if solution is cloudy, discoloured or contains particles.

Contact your nurse specialist if any of the above happens.

Use of SClg when unwell, pregnant or breastfeeding

Contact your doctor or nurse specialist for further advice if you:

- Are unwell with a fever.
- Suspect you are pregnant.
- Are breast feeding.

Your doctor and nurse specialist will work with you to develop a plan to respond to any adverse reaction.
SCIlg and vaccinations

Some immunisations may not be required while on SCIlg. Discuss this with your doctor.

Travelling with SCIlg

People travelling with SCIlg should:

- Plan well in advance before travelling.
- Obtain advice from their doctor or nurse specialist before travelling, especially overseas, as an export permit may be required.
- Use the ASCIA SCIlg Travel Plan, completed by their nurse or medical specialist Travel Plans are available on the ASCIA website www.allergy.org.au/hp/papers/ascia-travel-plan-for-scig-patients
- Take their SCIlg Travel Plan and Treatment Plan in hand luggage.
- Consider having a dose of Intravenous Immunoglobulin G (IVlg) before travel, which may be a convenient alternative.
- Consider having extra SCIlg infusions before and after the trip, for shorter periods of travel.
- Pack SCIlg in hand luggage when flying, whilst maintaining the cold chain and remembering to collect it before they leave the plane. SCIlg must not be put into checked-in luggage.
- Carry pain medication and a non-drowsy antihistamine in case of adverse reactions.
- Take enough consumable equipment for the time they are away from home.
- Pack enough SCIlg for the trip and store this in original packaging until needed, in a cool box or cooler bag. It is important to keep SCIlg at an appropriate temperature as specified for the product, at all times. Patients should check product information, and if uncertain, check with their nurse specialist. SCIlg should never be stored below 2°C or above 25°C.
Managing side effects of SCIg

Common local reactions at the infusion site include:

- Mild or moderate swelling (egg sized lump).
- Hardness.
- Blanching (whiteness).
- Redness at the infusion site.

These reactions are normal and short lived, usually gone by the next day. They are more common in people who have just started SCIg, especially in the first few months.

Most people start to notice a decrease in local reactions after about 8-10 weeks.

Over time, the skin will “get used” to the repeated infusions, and local reactions will lessen.

Using the same SCIg infusion site versus rotating sites

Using the same site for SCIg infusions can help to reduce the amount of local swelling and redness that can occur after an infusion. However, rotating the infusion site is preferable for some patients, and may reduce the risk of scar tissue developing.

General steps to take if an infusion site reaction occurs

If an infusion site reaction occurs, you should:

- Apply gentle massage and warm or cold pack (according to your personal preference) to reduce discomfort. An ice pack should not be applied for four hours post infusion to ensure adequate absorption.
- Not rub or scratch the infusion site.
- Record site reactions in an infusion diary.
- Report unusual site reactions, such as extreme pain or discomfort, blistering or spreading redness to your nurse specialist.
- Refer to the table below for different ways to manage reactions or problems at the infusion site.
<table>
<thead>
<tr>
<th>Site Issue</th>
<th>Possible Cause/s</th>
<th>Management Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redness</td>
<td>Common reaction, which usually settles over 24 hours. If redness is excessive:</td>
<td>• If it does not cause discomfort, do nothing.</td>
</tr>
<tr>
<td></td>
<td>• In some cases it may be due to an allergy or sensitivity to tape.</td>
<td>• Warm or cold pack for short periods may help with discomfort.</td>
</tr>
<tr>
<td></td>
<td>• Needle may not have been inserted correctly or needle may be too short.</td>
<td>• Wrap warm/cold packs in a cloth - do not apply directly to the skin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Slow the infusion rate if uncomfortable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Try using an over the counter non-drowsy antihistamine.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Check correct needle placement/length with your nurse specialist.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Consider alternative tapes/dressings to secure needle/s with your nurse specialist.</td>
</tr>
<tr>
<td>Swelling</td>
<td>Common reaction, which usually settles over 24 hours. Swelling usually results</td>
<td>• If it does not cause discomfort, do nothing.</td>
</tr>
<tr>
<td></td>
<td>from the amount of fluid being infused underneath the skin (amount of swelling</td>
<td>• A warm pack for short periods may help with absorption.</td>
</tr>
<tr>
<td></td>
<td>should relate to the volume being infused).</td>
<td>• A cold pack for short periods may help with discomfort, but delays absorption.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Wrap warm/cold packs in a cloth - do not apply directly to the skin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Take a walk to help with absorption.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Check correct needle placement/length with your nurse specialist.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• May need to decrease volume at the site, reduce the rate or change the infusion site. This should</td>
</tr>
<tr>
<td></td>
<td></td>
<td>be discussed with your nurse specialist.</td>
</tr>
<tr>
<td>Itching or burning</td>
<td>• Incorrect needle placement.</td>
<td><strong>Do not scratch or rub.</strong></td>
</tr>
<tr>
<td></td>
<td>• Incorrect needle length.</td>
<td>• Check needle placement and length.</td>
</tr>
<tr>
<td></td>
<td>• Irritation from tape.</td>
<td>• Try using an over the counter non-drowsy antihistamine.</td>
</tr>
<tr>
<td></td>
<td>• Ig at needle tip, causing skin irritation.</td>
<td>• Consider alternative tapes/dressings to secure needle/s.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Apply cold pack for short periods - wrap pack in a cloth - do not apply directly to the skin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Discuss dry priming with your nurse specialist.</td>
</tr>
<tr>
<td>Pain with infusions</td>
<td>• Incorrect needle placement.</td>
<td><strong>Check needle placement/length.</strong></td>
</tr>
<tr>
<td></td>
<td>• Incorrect needle length.</td>
<td>• Apply cold pack for short periods - wrap pack in a cloth - do not apply directly to the skin.</td>
</tr>
<tr>
<td></td>
<td>• Infusion going too fast.</td>
<td>• Slow infusion rate.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Try simple pain medication (such as paracetamol) before starting the infusion.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Take a walk to provide a distraction.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Check tape placement for pulling on skin or body hair.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Discuss with your nurse specialist.</td>
</tr>
<tr>
<td>Blanching (whiteness)</td>
<td>Normal tightening of tissue that can occur as SCIg infuses into the fatty</td>

Management guide for other reactions to SClg

**MILD REACTION**

If any one of the following symptoms occur:

- Headache, flushing, feeling sick, shivering, muscle aches, mild generalised itching, anxiety, dizziness, irritability or other mild symptoms

**STOP INFUSION**

Take non-drowsy antihistamine and/or pain medication

If symptoms improve or go away, restart infusion

If symptoms **DO NOT** improve, **REMOVE NEEDLE(S)**

Inform your doctor or nurse specialist as soon as practical

**MODERATE REACTION**

If any one of the following symptoms occur:

- Severe generalised itching, widespread skin rash, or any of the mild symptoms are getting worse

**STOP INFUSION AND REMOVE NEEDLE(S)**

If not taken earlier, take non-drowsy antihistamine and/or pain medication

Inform your doctor or nurse specialist as soon possible

**SEVERE REACTION**

If any one of the following symptoms occur:

- Breathlessness or wheezing, extreme dizziness or fainting, feeling of severe pressure in chest or feeling you are about to collapse, or any of the moderate symptoms continue to get worse

**STOP INFUSION AND REMOVE NEEDLE(S)**

Dial 000 (AU) or 111 (NZ) to get urgent medical help

Lie down

Inform your doctor or nurse specialist as soon possible
