

What is causing your allergy?

The first step in the management of allergic disease is identifying the allergen/s causing the problem. In some cases, the allergen/s may be obvious. However in other cases, it may require medical evaluation using proven investigational tools. Once the allergen/s are identified, steps can be taken to minimise the risk of exposure to the causative allergen(s).

Keeping a record of symptoms is important

Diagnosing an allergy can be quite a difficult process, requiring considerable medical expertise, since the symptoms may often be similar to other conditions. For instance, many people suffer from a repeated sore throat and runny nose which they think is a recurrent cold, when in fact they may be suffering from allergic rhinitis (hay fever). Allergy may be responsible for other conditions such as asthma, upset stomach and skin rashes.

If you think you may be allergic to something and do not know what it is, you should start to keep a record of your symptoms. This will help you to find out what you may be allergic to. Once you have found this out you can then take steps to minimise your exposure to the allergen.

Aeroallergen minimisation and food allergen avoidance information is available from the ASCIA website:

www.allergy.org.au/patients/allergy-treatment

www.allergy.org.au/patients/food-allergy

It is then important to keep a regular diary of when your symptoms occur. It is also useful to make a note of the general patterns of your symptoms. The following information may be useful to your doctor:

- Do your symptoms occur when you are inside the house, outside the house or both inside and outside?
- Do you suffer more at night time or during the day?
- Do you wake up with symptoms in the morning?
- Do you only get symptoms at certain times of the year?
- Does exposure to animals bring on your symptoms?
- Do you think that any food or drink brings on your symptoms?

It is important to seek medical advice

If you think you are suffering from an allergy, visit your doctor or pharmacist for advice. They will want to know the history of your complaint, so the more information you can give them, the better.

If your allergy becomes a real problem, your doctor may do some tests to determine the cause of your allergy or may recommend that you visit an allergy/clinical immunology specialist for further investigation and treatment. In some cases, identifying the cause of allergic symptoms can be difficult and may require a lot of time and expertise. Investigation of food allergy can be a particularly involved procedure. However, once the offending allergen is identified, avoidance measures can be taken.

Information about allergy testing is available on the ASCIA website:

www.allergy.org.au/patients/allergy-testing

Effective prevention and treatment options for allergy are available

You do not have to put up with the suffering and inconvenience of allergic rhinitis (hay fever), as effective prevention and treatment options are available. If you think you may be suffering from an allergy, your doctor or pharmacist can advise you what to do. If your condition does not improve, consult your doctor as a referral to a specialist may be required.
